

Techniques to reduce N<sub>2</sub>O emissions derived  
from farmers' efforts to preserve water quality  
in tea fields

Masakazu Shiwa

Tea Research Institute, Agricultural Technology  
Promotion Center of Shiga Prefecture

# The beginning of tea, “Omi's Tea”

The history of tea in Shiga Prefecture is the oldest in Japan. It is said that in 805 about 1200 years ago, Dengyo Daishi Saicho brought back seeds from Tang (China) and planted it at the foot of Mt. Hiei. This tea garden still remains near the Hiyoshi Taisha Shrine (Sakamoto Otsu City).

Landscape of the traditional tea field  
that remains even now

Sencha

Plucked new shoots

Matcha

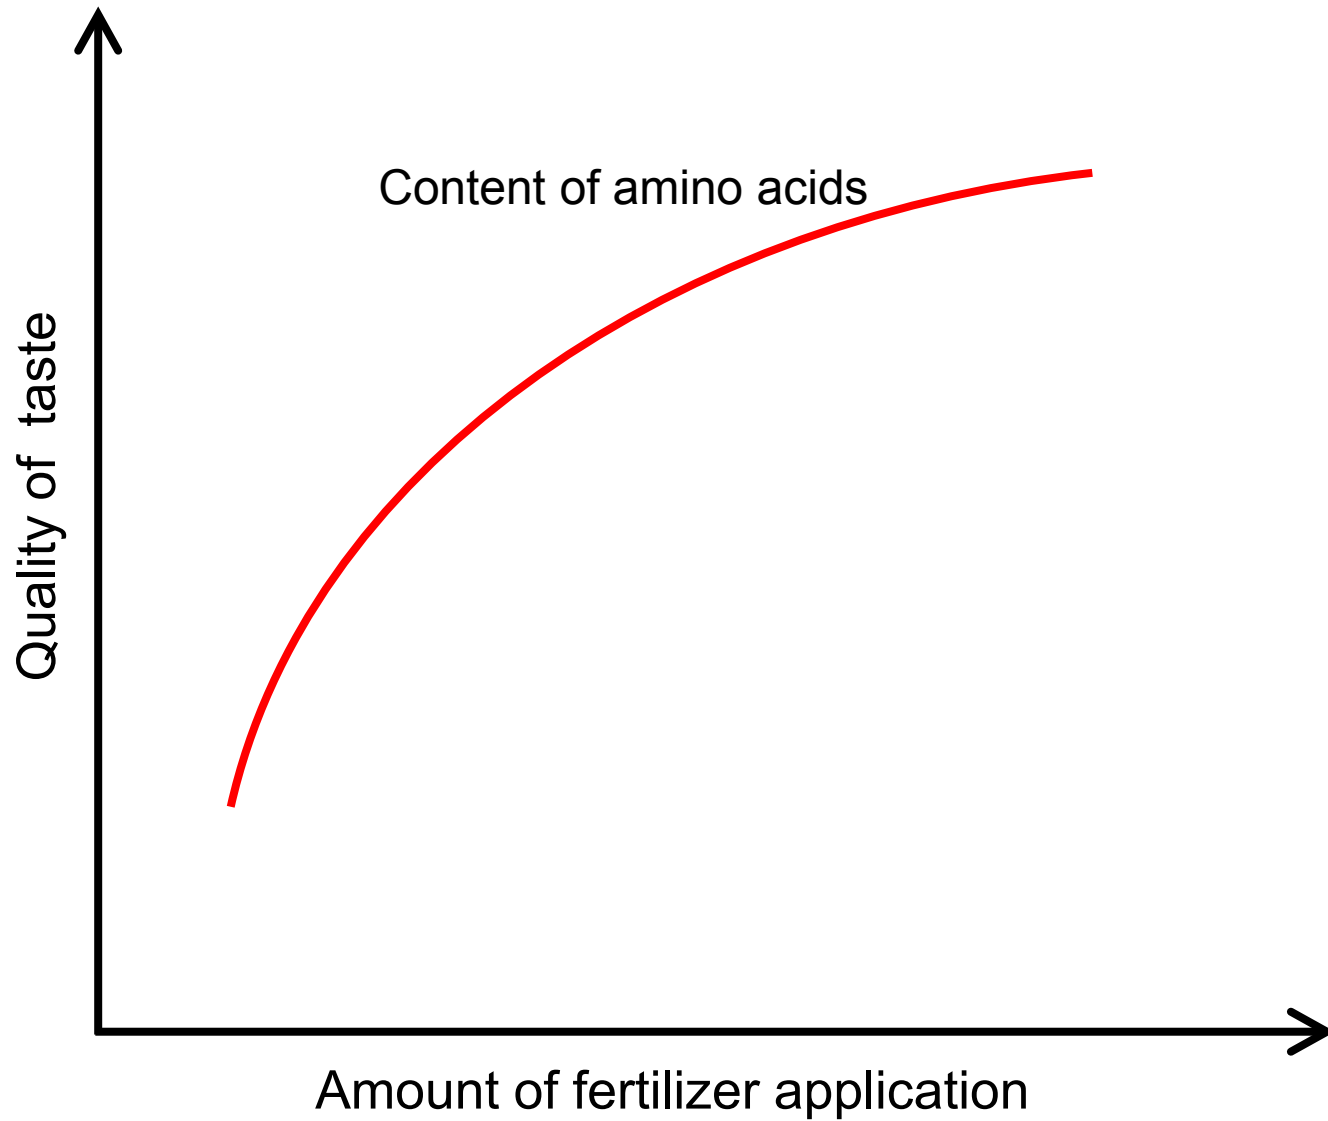

Fig. Relationship between the amount of fertilizer application and content of amino acids

A scenic view of Lake Biwa. In the foreground, dark branches of cherry blossoms with light pink flowers hang down from the top. The lake is a deep blue, and in the distance, a dark mountain is visible under a blue sky with light clouds.

Protecting Lake Biwa as it is the source of drinking water for 14 million people in the Kinki region

→ Studied on saving the nitrogen load caused by fertilizer application in tea fields

Effort to preserve water quality in tea fields  
Developed fertilizer application techniques for  
environmental conservation  
→ The water quality was improved by this effort

## However

### Comparison between farmers' tea fields and tea field of Tea Research Institute in developed fertilizer application technique

| Annual | Tea field of<br>Tea Research Institute |         | Farmers' tea fields |         |
|--------|--|---------|---------------------|---------|
|        | Yield                                  | Quality | Yield               | Quality |
| 1 year | ○                                      | ○       | ○                   | ○       |
| 2 year | ○                                      | ○       | ○                   | ○       |
| 3 year | Why did we get different results ?     |         |                     |         |
| 4 year | ○                                      | ○       | △                   | △       |
| 5 year | ○                                      | ○       | △                   | ×       |

○ : equal to or greater than conventional farmers' cultivation

△ : less than or equal to conventional farmers' cultivation

× : less than conventional farmers' cultivation

Conventional  
tea plucker

Tea culture management has been mechanized in Japan.

Rail-tracking type

Riding type

Adjust the height of tea plants according the machine

Pruning of canopy after the second crop in each year

Conventional space between the hedges

Space between the hedges after mechanization

There was a large difference in the state of accumulated litter in space between the hedges, which was where fertilizer was applied.

Space between the hedges  
after mechanization

# N<sub>2</sub>O emission potential in the litter, surface soil, and soil below 10 cm

## Incubation experiment

(According to the method of Tokuda and Hayatsu)

Fig. N<sub>2</sub>O emission potential in the litter, surface soil, and soil below 10 cm

Table. N<sub>2</sub>O emission potential per surface area

---

Incubation time (14 day)

---

|              | Per weight             | Per surface area    |                |
|--------------|------------------------|---------------------|----------------|
|              | $\mu\text{g N g}^{-1}$ | $\text{g N m}^{-2}$ |                |
| Litter       | 671                    | 12.9                | 16 cm in depth |
| surface soil | 50                     | 0.3                 | 1 cm in depth  |
| Soil         | 5                      | 0.5                 | 16 cm in depth |

---

# Measuring the N<sub>2</sub>O emissions in the space between hedges in a tea field

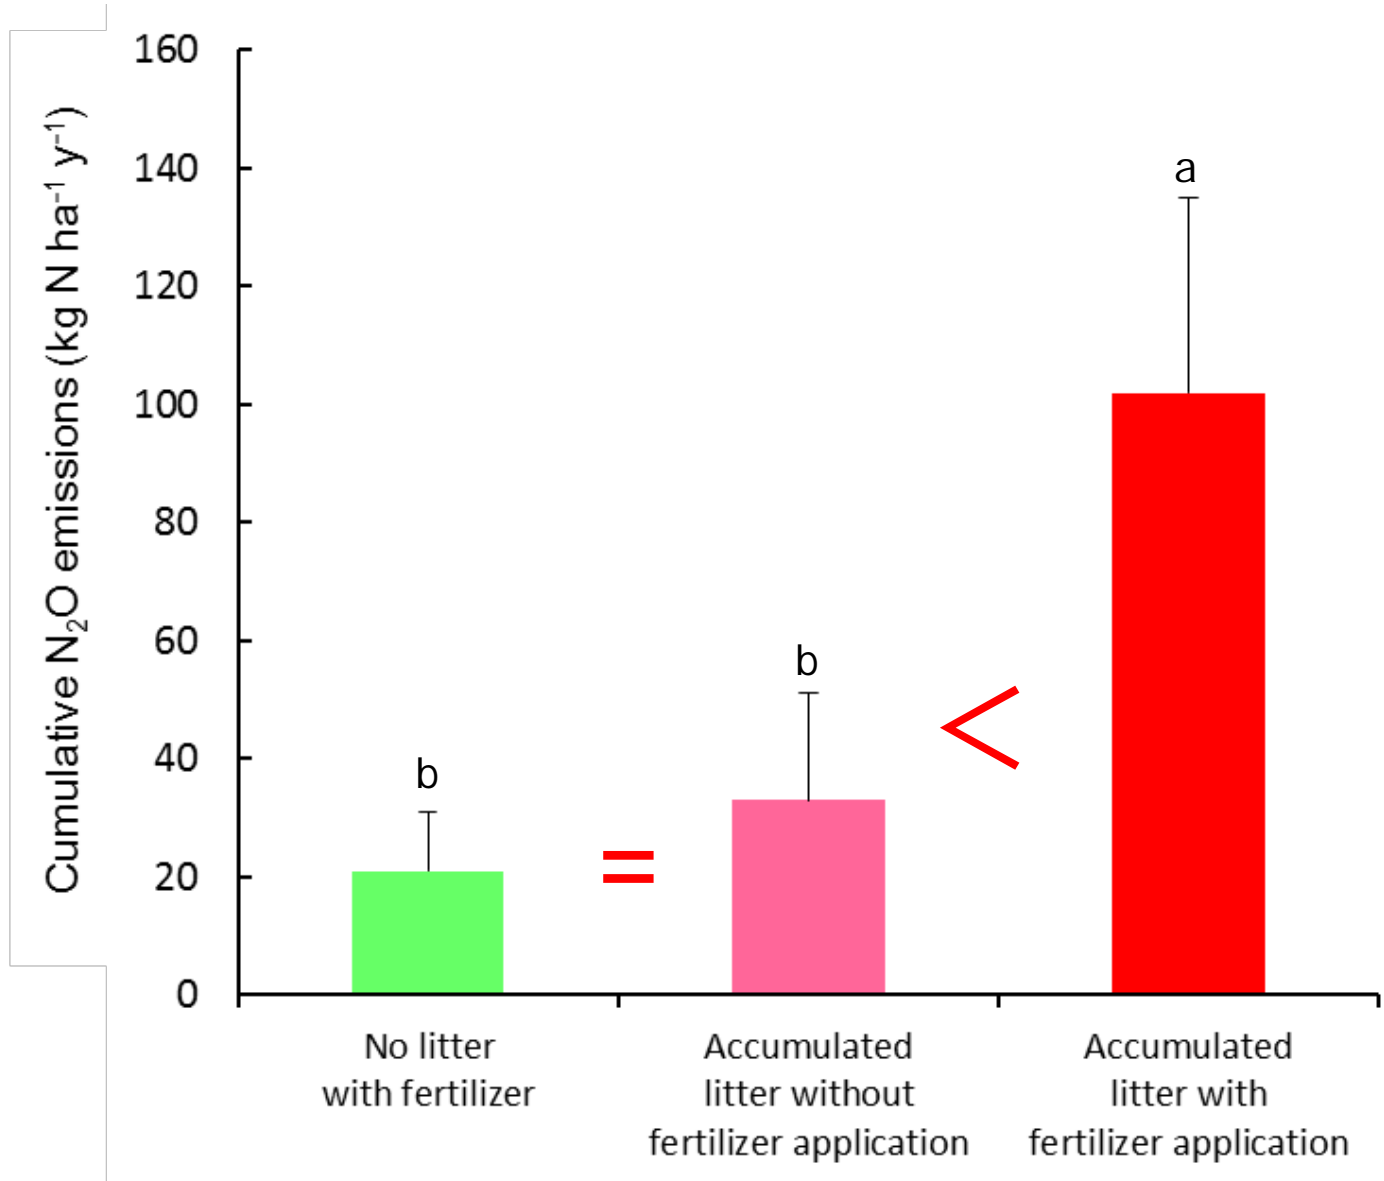

Fig. Cumulative N<sub>2</sub>O emissions in different soil environments  
 $p < 0.05$  according to REGWQ method

# Incorporation of litter with soil by deep plowing can reduce N<sub>2</sub>O emission

Cultivator for deep plowing

Before deep plowing

After deep plowing

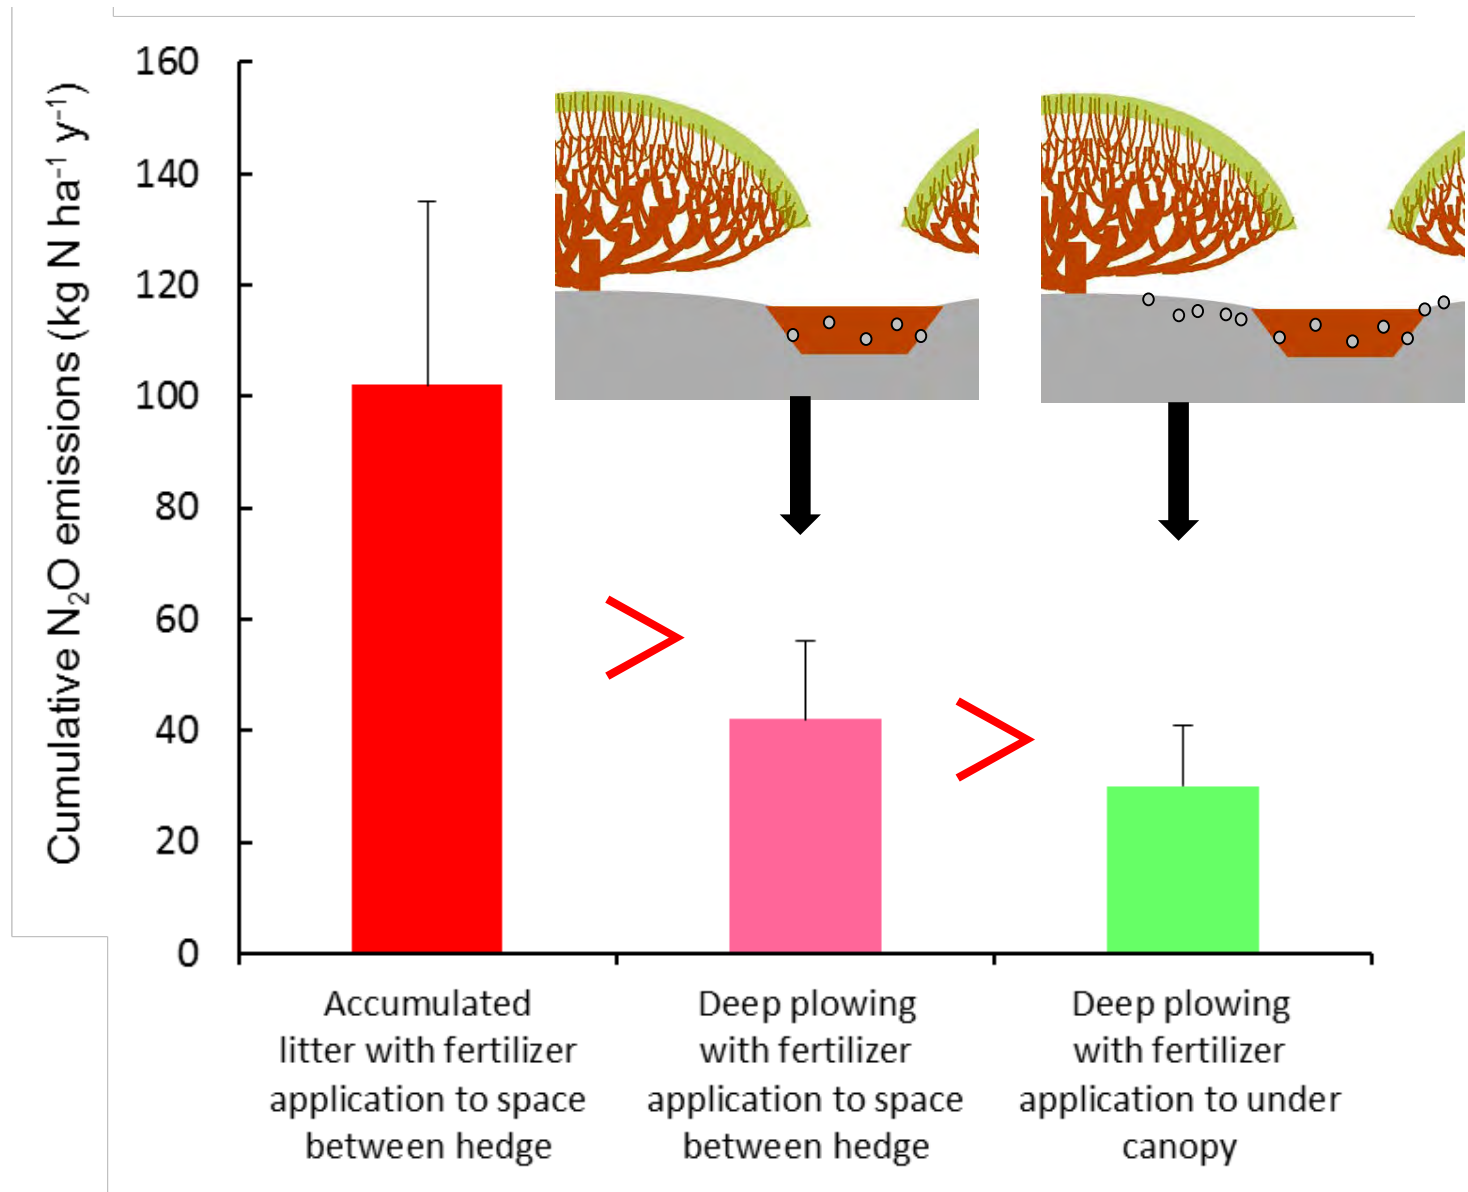

Fig. Cumulative N<sub>2</sub>O emission in deep plowing

---

| Developed techniques<br>(Deep plowing + Fertilizer application to under canopy) |         |                 |
|---|---------|-----------------|
| Yield   | Quality | Production cost |
| ○   | ○       | ◎               |

---

◎ : greater than conventional farmers' cultivation

○ : equal to or greater than conventional farmers' cultivation

Farmers' efforts to preserve water quality in Lake Biwa led to techniques to reduce N<sub>2</sub>O emissions in tea fields.

These techniques are now being used in 50-70% of the areas in Shiga Prefecture in Japan.
